Cobilas Core

Descripition

Cobilas Core Net4x is a utility library for CSharp.

Json

(namespace:Cobilas.IO.Serialization.Json)
Only present in the NuGet version.
The static class `Json` grants static read and write functions.

JsonContractResolver

Used by `JsonSerializer` to resolve a `JsonContract` for a given `Type`. Furthermore, `JsonContractResolver` determines how the fields of an `Object` will be serialized.

ATLF(Arquivo de tradução de leitura facil)

ATLF (Easy to Read Translation File) can be used to create and load translations for apps.

```
#>Header
The use of the header is not mandatory.<#
#! version:/*std:1.0*/
#! encoding:/*utf-8*/

#> Comment <#
#> ATLF format(1.0) <#

#> Uni-line marking <#
#! Tag1:/*value1*/

#> Multi-line marking <#
#! Tag2:/*
value1
value2
value3
value4
*/
```

How to read ATLF

```
static void Main(string[] args) {
    using ATLFReader reader = ATLFReader.Create(@"C:\folder1\file.txt");
    reader.Reader();
```

```
    Console.WriteLine($"tag.value.1:{reader.GetTag("tag.value.1")}");
    Console.WriteLine($"tag.value.2:{reader.GetTag("tag.value.2")}");
    Console.WriteLine($"tag.value.3:{reader.GetTag("tag.value.3")}");
}
```

The other reading functions.

- The `ATLFNode[]:ATLFReader.GetHeader()` function allows you to get the header tags.
- The `ATLFNode[]:ATLFReader.GetAllComments()` function allows you to get all comments. The `ATLFNode[]:ATLFReader.GetTagGroup(string path)` function allows you to obtain tags that belong to the same path.

```
/*C:\folder1\file.txt
* #! version:/*std:1.0* /
* #! encoding:/*utf-8* /
*
* #! tag.value.cop1:/*value1* /
* #! tag.value.map.cop1:/*value1* /
* #! tag.value.map.cop2:/*value1* /
* #! tag.value.cop2:/*value1* /
* #! tag.value.cop3:/*value1* /
*/
static void Main(string[] args) {
    using ATLFReader reader = ATLFReader.Create(@"C:\folder1\file.txt");
    reader.Reader();
    foreach(var item in reader.GetTagGroup("tag.value.map"))
        Console.WriteLine(item);
}
```

How to write ATLF

```
static void Main(string[] args) {
    using ATLFWriter writer = ATLFWriter.Create(File.OpenWrite(@"C:\folder1\file.txt"));
    writer.WriteHeader();//The header is not mandatory but if you add a header, call this
function first.
    writer.WriteComment("my tag1");
    writer.WriteNode("tag1", "value1");
    writer.WriteWhitespace("\r\n");//This function is called automatically when the `Indent`
property is `true`. By default the `Indent` property is `true`.
    writer.WriteComment("my tag2");
    writer.WriteNode("tag2", "value2");
    writer.WriteWhitespace(2, "\r\n");//This function is called automatically when the
`Indent` property is `true`. By default the `Indent` property is `true`.
    writer.WriteComment("my tag3");
```

```
    writer.WriteNode("tag3", "value3");
}
```

Encoders and decoders

Regarding encoders and decoders, ATLF allows the creation of customized encoders and decoders. To use a custom encoder or decoder, assign a version to your custom encoder or decoder using the `Version` property and then assign the version of the custom encoder or decoder in the `TargetVersion` property of the `ATLFWriter` and `ATLFReader` classes.

Creating a custom encoding class

To create a custom encoding class, the class must inherit the `ATLFVS10Encoding` class.

Creating a custom decoding class

To create a custom decoding class, the class must inherit the `ATLFVS10Decoding` class.

Cobilas.Core.Net4x is on nuget.org

To include the package, open the `.csproj` file and add it.

```
<ItemGroup>
  <PackageReference Include="Cobilas.Core.Net4x" Version="1.4.0" />
</ItemGroup>
```

Or use command line.

```
dotnet add package Cobilas.Core.Net4x --version 1.4.0
```

Cobilas.Core.Net4x is on NPM

Include in npm package

```
"dependencies": {
    "com.cobilas.unity.core.net4x":"1.4.0"
}
```

Or use command line.

```
npm i com.cobilas.unity.core.net4x
```

Cobilas Godot Utility

Cobilas.GodotEngine.Utility

Descripition

The package contains utility classes in csharp for godot engine(Godot3.5)

RunTimeInitialization

(namespace: Cobilas.GodotEngine.Utility.Runtime)
The `RunTimeInitialization` class allows you to automate the `Project>Project Settings>AutoLoad` option.
To use the `RunTimeInitialization` class, you must create a class and make it inherit `RunTimeInitialization`.

```
using Cobilas.GodotEngine.Utility.Runtime;
//The name of the class is up to you.
public class RunTimeProcess : RunTimeInitialization {}
```

And remember to add the class that inherits `RunTimeInitialization` in `Project>Project Settings>AutoLoad` .
Remembering that the `RunTimeInitialization` class uses the virtual method `_Ready()` to perform the initialization of other classes.
And to initialize other classes along with the `RunTimeInitialization` class, the class must inherit the `Godot.Node` class or some class that inherits `Godot.Node` and use the `RunTimeInitializationClassAttribute` attribute.

```
using Godot;
using Cobilas.GodotEngine.Utility.Runtime;
[RunTimeInitializationClass]
public class ClassTest : Node {}
```

RunTimeInitializationClass

```
/*
bootPriority: Represents the boot order
{ (enum Priority)values
        StartBefore,
        StartLater
}
name:The name of the object
```

```
subPriority: And the execution priority order.
*/
[RunTimeInitializationClass(Priority bootPriority, string name, int subPriority)]
[RunTimeInitializationClass(Priority bootPriority)]
[RunTimeInitializationClass(Priority bootPriority, string name)]
[RunTimeInitializationClass(string name, int subPriority)]
[RunTimeInitializationClass(string name)]
[RunTimeInitializationClass()]
```

The Cobilas Godot Utility is on nuget.org

To include the package, open the `.csproj` file and add it.

```
<ItemGroup>
  <PackageReference Include="Cobilas.Godot.Utility" Version="1.5.3" />
</ItemGroup>
```

Or use command line.

```
dotnet add package Cobilas.Godot.Utility --version 1.5.3
```
