Namespace Cobilas

Classes

<u>TypeUtilitarian</u>

Utility static class to obtain type or assembly.

Structs

<u>Interrupter</u>

Represents a list of switches.

Cobilas Core

Descripition

Cobilas Core Net4x is a utility library for CSharp.

Json

(namespace:Cobilas.IO.Serialization.Json)

Only present in the NuGet version.

The static class Json grants static read and write functions.

JsonContractResolver

Used by JsonSerializer to resolve a JsonContract for a given Type. Furthermore, JsonContractResolver determines how the fields of an Object will be serialized.

ATLF(Arquivo de tradução de leitura facil)

ATLF (Easy to Read Translation File) can be used to create and load translations for apps.

```
#>Header
The use of the header is not mandatory.<#
#! version:/*std:1.0*/
#! encoding:/*utf-8*/

#> Comment <#
#> ATLF format(1.0) <#

#> Uni-line marking <#
#! Tag1:/*value1*/

#> Multi-line marking <#
#! Tag2:/*
value1
value2
value3
value4
*/</pre>
```

How to read ATLF

```
static void Main(string[] args) {
   using ATLFReader reader = ATLFReader.Create(@"C:\folder1\file.txt");
   reader.Reader();
```

```
Console.WriteLine($"tag.value.1:{reader.GetTag("tag.value.1")}");
Console.WriteLine($"tag.value.2:{reader.GetTag("tag.value.2")}");
Console.WriteLine($"tag.value.3:{reader.GetTag("tag.value.3")}");
}
```

The other reading functions.

- The ATLFNode[]:ATLFReader.GetHeader() function allows you to get the header tags.
- The ATLFNode[]:ATLFReader.GetAllComments() function allows you to get all comments. The ATLFNode[]:ATLFReader.GetTagGroup(string path) function allows you to obtain tags that belong to the same path.

```
/*C:\folder1\file.txt
* #! version:/*std:1.0* /
* #! encoding:/*utf-8* /

* #! tag.value.cop1:/*value1* /
* #! tag.value.map.cop1:/*value1* /
* #! tag.value.map.cop2:/*value1* /
* #! tag.value.cop2:/*value1* /
* #! tag.value.cop3:/*value1* /
* #! tag.value.cop3:/*value1* /

* #! tag.value.cop3:/*value1* /

* #! tag.value.cop3:/*value1* /

* #! tag.value.cop3:/*value1* /

* Console.WriteLine(item);
}
```

How to write ATLF

```
static void Main(string[] args) {
    using ATLFWriter writer = ATLFWriter.Create(File.OpenWrite(@"C:\folder1\file.txt"));
    writer.WriteHeader();//The header is not mandatory but if you add a header, call this
function first.
    writer.WriteComment("my tag1");
    writer.WriteNode("tag1", "value1");
    writer.WriteWhitespace("\r\n");//This function is called automatically when the `Indent`
property is `true`. By default the `Indent` property is `true`.
    writer.WriteComment("my tag2");
    writer.WriteNode("tag2", "value2");
    writer.WriteWhitespace(2, "\r\n");//This function is called automatically when the
`Indent` property is `true`. By default the `Indent` property is `true`.
    writer.WriteComment("my tag3");
```

```
writer.WriteNode("tag3", "value3");
}
```

Encoders and decoders

Regarding encoders and decoders, ATLF allows the creation of customized encoders and decoders. To use a custom encoder or decoder, assign a version to your custom encoder or decoder using the Version property and then assign the version of the custom encoder or decoder in the TargetVersion property of the ATLFWriter and ATLFReader classes.

Creating a custom encoding class

To create a custom encoding class, the class must inherit the ATLFVS10Encoding class.

Creating a custom decoding class

To create a custom decoding class, the class must inherit the ATLFVS10Decoding class.

Cobilas.Core.Net4x is on nuget.org

To include the package, open the .csproj file and add it.

```
<ItemGroup>
  <PackageReference Include="Cobilas.Core.Net4x" Version="1.6.1" />
</ItemGroup>
```

Or use command line.

```
dotnet add package Cobilas.Core.Net4x --version 1.6.1
```

Cobilas.Core.Net4x is on NPM

Include in npm package

```
"dependencies": {
    "com.cobilas.unity.core.net4x":"1.6.1"
}
```

Or use command line.

```
npm i com.cobilas.unity.core.net4x
```

Namespace Cobilas.GodotEngine.Utility

Classes

Coroutine

CoroutineManager

GDDirectory

GDFeature

GDFile

GDFileBase

GDIONull

Gizmos

Gizmos are used to give visual debugging or setup aids in the Scene view.

Randomico

The class allows the creation of pseudo random numbers.

Screen

Structs

FixedRunTimeSecond

RunTimeSecond

Interfaces

IYieldCoroutine

<u>IYieldFixedUpdate</u>

<u>IYieldUpdate</u>

<u>IYieldVolatile</u>

Enums

GDFileAttributes

Represents the file attributes.

ScreenMode

Represents screen modes.

Cobilas Godot Utility

Descripition

The package contains utility classes in csharp for godot engine(Godot3.5)

RunTimeInitialization

(namespace: Cobilas.GodotEngine.Utility.Runtime)

The RunTimeInitialization class allows you to automate the Project>Project Settings>AutoLoad option.

To use the RunTimeInitialization class, you must create a class and make it inherit RunTimeInitialization.

```
using Cobilas.GodotEngine.Utility.Runtime;
//The name of the class is up to you.
public class RunTimeProcess : RunTimeInitialization {}
```

And remember to add the class that inherits RunTimeInitialization in Project>Project Settings>AutoLoad .

Remembering that the RunTimeInitialization class uses the virtual method _Ready() to perform the initialization of other classes.

And to initialize other classes along with the RunTimeInitialization class, the class must inherit the Godot.Node class or some class that inherits Godot.Node and use the

RunTimeInitializationClassAttribute attribute.

```
using Godot;
using Cobilas.GodotEngine.Utility.Runtime;
[RunTimeInitializationClass]
public class ClassTest : Node {}
```

RunTimeInitializationClass

```
[RunTimeInitializationClass(Priority bootPriority, string name, int subPriority)]
[RunTimeInitializationClass(Priority bootPriority)]
[RunTimeInitializationClass(Priority bootPriority, string name)]
[RunTimeInitializationClass(string name, int subPriority)]
[RunTimeInitializationClass(string name)]
[RunTimeInitializationClass()]
```

The Cobilas Godot Utility is on nuget.org

To include the package, open the .csproj file and add it.

```
<ItemGroup>
  <PackageReference Include="Cobilas.Godot.Utility" Version="1.5.3" />
  </ItemGroup>

Or use command line.
```

dotnet add package Cobilas.Godot.Utility --version 1.5.3
